

C1 extends C2

Program Code:

```
package core_java;

class C2 {
    void showCollege() {
        System.out.println("Welcome to C2 College");
    }

    void showCourse() {
        System.out.println("Course: Computer Science");
    }
}

class C1 extends C2 {
    void showStudent() {
        System.out.println("Student Name: Ravi");
    }
}

public class C1toC2 {
    public static void main(String[] args) {
        C1 obj = new C1();

        obj.showCollege();
        obj.showCourse();
        obj.showStudent();
    }
}
```

Explanation:

This program demonstrates single inheritance. Class C1 extends class C2. Therefore, the object of C1 can access the inherited methods showCollege() and showCourse() from C2, as well as its own method showStudent().

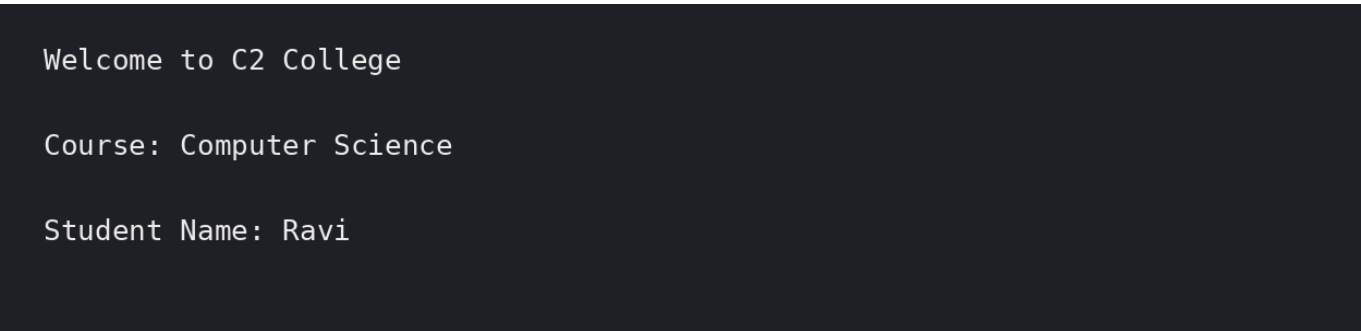

Compilation and Execution Commands:

Save the file as: C1toC2.java

Compile:
javac -d . C1toC2.java

Run:
java core_java.C1toC2

Output Screenshot:

```
Welcome to C2 College

Course: Computer Science

Student Name: Ravi
```

Verification:

The output confirms that the C1 object successfully calls showCollege() and showCourse() from the parent class C2 and showStudent() from its own class.

Result:

Thus, the program was successfully executed and the relationship C1 extends C2 was verified successfully.
