

C1 implements I1

Program Code:

```
package core_java;

interface I1 {
    void login();
    void logout();
}

class C1 implements I1 {

    public void login() {
        System.out.println("User logged in successfully");
    }

    public void logout() {
        System.out.println("User logged out successfully");
    }

    void showProfile() {
        System.out.println("Profile is displayed");
    }
}

public class C1toI1 {
    public static void main(String[] args) {

        C1 obj = new C1();

        obj.login();
        obj.showProfile();
        obj.logout();
    }
}
```

Explanation:

This program demonstrates interface implementation. Interface I1 declares the methods login() and logout(). Class C1 implements I1 and provides the implementation for both methods. Class C1 also contains its own method showProfile().

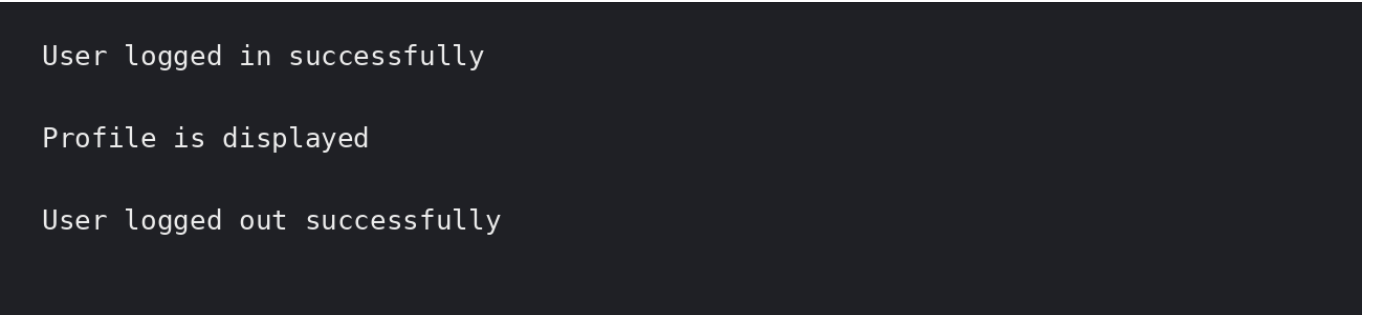

Compilation and Execution Commands:

Save the file as: C1toI1.java

Compile:
javac -d . C1toI1.java

Run:
java core_java.C1toI1

Output Screenshot:

```
User logged in successfully

Profile is displayed

User logged out successfully
```

Verification:

The output confirms that class C1 successfully implements the methods declared in interface I1 and also executes its own method.

Result:

Thus, the program was successfully executed and the relationship C1 implements I1 was verified successfully.
